

SYMP2PASS™

By SmartCone

SmartCone Technologies, Inc. is now validating SYMP2PASS to mitigate the risk of transmitting the COVID-19 virus. Integration of Symp2pass in our thermal and IoT solutions for businesses will give peace of mind to employees and patrons.

Key Features

- ✓ SYMP2PASS is the first end-to-end biometric process developed by medical doctors that provides advanced Covid-19 screening, analyzing, and geo-location mapping.
- ✓ For businesses with SmartCone Thermal or IoT solutions, employees and patrons can be screened before entering to provide a "safe space".

Device Independent Use

SYMP2PASS functions as a web application process which allows users to access the platform from cell phones, tablets and home computers.

RFID Registration

Individuals or businesses can purchase RFID bracelets to assign test results to an RFID code. The RFID bracelet is then scanned at a kiosk where temperature screening is completed.

Thermal Camera Integration

Employees and patrons can complete the temperature screening portion of the triage at Symp2pass subscriber locations with thermal camera kiosks.

Symptom Screening

Using a simple user interface, users answer questions regarding COVID19 symptoms including recent headache, fever, temperature, and cough.

AI Cough and Breathing Assessment

AI is integrated into the SYMP2PASS web application to provide analysis of breathing patterns and cough as part of the triage assessment.

Geo-Location Mapping

The SYMP2PASS web process uses user location to provide the closest location of testing sites. Businesses that integrate kiosks will be shown on personalized maps near users.

Screening Results Interpretation

Screening results and breathing & cough tests are analysed, users are deemed safe from COVID-19 and allowed entry or referred to the nearest testing site.
